Description	Qty	Price	ROM	Notes
				<p>The YS170 Single-loop Programmable Controller is an intelligent controller with analog and sequence logic computations for process control to be programmed using a simple language. Also, in some control modes, no programming is required. A full-dot-matrix LCD display offers four types of analog-like operation panels, and dual-loop display panel is a easy to use. Operations are performed by simply pressing the front panel keys. Control of two loops, including dual-loop independent control modes, is performed by just one unit. Versatile status I/Os, unique preset PID control, trend-viewing function and MV output manual backup circuit are equipped as a standard. Also, direct coupling with field signal and communication function are available as an option. Programming work for YS170 is performed by a PC (with YSS20 Programming Package - separately required).</p>
